Ahanf Akib Ahmed(2312304642)

In this week i was working with ta backend part. I made a proper database and connect it with frontend part. Now the login, Resister and other system like enter new certificate, enter new medicine, enter new tutorial certificate is working perfectly. I worked with the frontend part and make separate dashboard for different types of user. I worked with Ai integration. It's almost done. I was facing problem due to Ai versions.I was using gemini ai version 1.3. It's show some problem in generating documents. I made the system in which user will not just verify with database. If any document is missing they can assume the probability of getting accurate data. They can get information about if this medicine is good for their patient. In the next week I will be done with Ai implementation.

Mohammad Zonayet Hassan Polok(2031267642)This week, I concentrated on stabilizing the backend and fully implementing the core Dual Verification system. I cleaned up the main project files and finalized the server logic to perform both a Blockchain integrity check and an AI Verification check that provides an authenticity score, which addresses the requirement for assuming data accuracy even if documents are incomplete. My biggest challenge was solving the file corruption issue in the main `package.json`, which had caused installation and runtime errors, delaying the final AI integration. With these file issues now resolved, I will spend next week ensuring all backend dependencies are confirmed, the MongoDB data seeding is seamless, and connecting the Dual Verification results (Blockchain status and AI score) to the frontend interface for the user.

Part: Medicine Verification Feature Setup

I focused on developing the Medicine Verification feature of our project Asure. I completed the initial frontend implementation using HTML, CSS, and JavaScript, and designed a clean interface for users to enter and verify medicine codes. I also prepared and uploaded a corresponding SQL schema file that represents the medicine verification data structure. The feature currently simulates the verification process using frontend logic, and I organized all related files into a separate folder and uploaded it to the team GitHub repository as my weekly contribution. In the next week, I will work on connecting this feature to the backend API and integrating it with our SQL database for real-time verification.

Sumya akter(21119133642)

Part: Blockchain-Backed QR Code Feature

I worked on developing the Blockchain-Backed QR Code feature for our project Asure. I completed the frontend implementation using HTML, CSS, and JavaScript, designing a clean interface that displays a generated QR code and links it to a blockchain record.
